

# Copeland Scroll™ multiples

for commercial air conditioning and chiller applications

# Setting the standard

Today's commercial air conditioning applications are as varied as the customers you serve. Each one has its own set of challenges and demands, but several requirements remain constant. Your customers deserve innovative technologies that leverage proven reliability methods and offer consistently high performance. Downtime is not an option for their business – and your reputation. When it comes to offering innovative, reliable, high performing compressors, Copeland Scroll™ continues to set the industry standard.

## Step modulation

One form of stepped modulation technology applied in some air conditioning applications is an approach that utilizes multiple compressors connected with a manifold, commonly referred to as tandems. Similar to other modulation approaches, tandems offer improved part-load efficiencies, including Integrated Energy Efficiency Ratio (IEER) and Integrated Part Load Value (IPLV), while maximizing full-load efficiency. A user also has the option to 'tandemize' a Copeland Scroll Digital™ compressor with a fixed capacity scroll compressor. This combination offers a very simple solution to deliver continuous capacity modulation while providing exceptional part-load efficiencies, such as Integrated Part Load Value (IPLV).

When Emerson first pioneered the use of scroll technology in compressors, it changed the industry forever. Since then, Copeland Scroll technology remains at the forefront for HVACR

applications. With the broadest product line in the industry, Copeland Scroll compressors range from 1-40 HP for single compressor configurations and 3-120 HP in tandem and trio configurations. This includes 51 uneven and 69 even tandem compressor combinations.

## Example

System capacity can be modulated by using multiple refrigeration circuits or by using multiple compressors in single-circuit systems. In a four circuit system, commonly used in packaged rooftops, individual compressors can be turned on and off to achieve a specific output. Six to eight compressors per unit can be used, which means, depending on the even or uneven combination, up to 12 capacity steps available to match the load by cycling the compressors on and off.

## Copeland Scroll Compressors

- ◆ More than 100 million installations worldwide
- ◆ Over 3 million Copeland Scroll UltraTech™ and Copeland Scroll Digital™ compressors installed
- ◆ 25 years experience as the leader in scroll compression technology

### Advantages of stepped modulation

- Efficiency: High system efficiency at both full-load and part-load
- Installation costs: Least expensive form of modulation
- Reliability: Comparable to fixed compressor systems
- Flexibility: Wide and smooth system lineup with a limited number of compressor models
- Oil management: No extra oil management hardware needed
- Electromagnetic interference issues: None
- Stepped capacity modulation for precision load matching which enables OEMs to boost system part load efficiency levels to meet new energy standards and aggressive DOE challenges

### Industrial standards

Industry standards introduce part-load efficiency requirements for light commercial split, package and rooftop systems by adding IEER to the ASHRAE 90.1 standard. In addition, voluntary industry standards ASHRAE 189.1, Energy Star and CEE standards also specify improved part-load efficiency. One way to meet these standards is by applying multiple compressors in the system design to deliver step capacity modulation for precision load matching and high part load efficiency levels.
