Pressure Vessel Fabrication & Codes

Size of Vessel	Construction and Certification generally acceptable, furnished unless otherwise specified
Under six inches ID	UL Listing
Six inches or greater ID, but less than 1.5 cubic feet net internal volume	ASME Code Construction with UM Certification and UL Recognition
Six inches or greater ID, with over 1.5 cubic feet net internal volume	ASME Code Construction with U Certification and National Board Registration

Notes

UL Listing may be obtained for a vessel, typical samples of which can withstand five times the marked working pressure without failure for the gas side and three times the marked working pressure without failure for the fluid side. Initial tests are made at Underwriters Laboratory and reexamination tests are made under UL supervision, at the manufacturer's plant.

ASME Code Construction is the same whether UM or U certified. Essentially, the vessel must have a calculated design strength capable of withstanding the maximum allowable working pressure (MAWP) and tested pneumatically to 1.1 time the MAWP or hydrostatically to 1.3 times the MAWP. Certain details of construction must be observed, and chemical and physical test certification for all material must be on file. Welding procedures, equipment, and personnel must be qualified by performance tests. UM Certification means that the manufacturer's personnel have performed the necessary inspection and tests. The letters UM appear in the ASME cloverleaf stamp on the tag. Only when requested, a certificate (Form U-3) is furnished, signed by the manufacturer.

UL Recognition of UM vessels. Their testing, and reexamination procedure is identical to that for listing. This recognition requirement comes about because UL takes the position that someone other than the manufacturer should check the construction. The recognition list is not published —as is the listing—the records are kept by UL and generally used only when granting listing to an assembly that includes the vessel.

National Board Registration means that in addition to the ASME construction, an independent, licensed inspector has monitored the procedures, fabrication and testing of the vessel. The letter U appears in the ASME cloverleaf stamp on the tag. We recommend referring to Nat. Bd., rather than U-stamp, to avoid confusion between U and UM.

Underwriters Laboratory will automatically accept a National Board registered vessel when listing an assembly, because it has been inspected by an independent agent, to specifications more strict than their own. A National Board certified vessel is accepted by all state and municipal codes in the United States. Most other countries will accept them also. Certain government or military requirements essentially parallel the ASME code, but may specify approval and/or certification by inspectors from a government agency in addition to, or in place of ASME code, or UL requirements.

International Code Stamps

CRN Canadian registration is available on cataloged models. CRN or special code requests should be made at time of order.

Other international codes possibly available upon request include New Zealand, Australia, Japan, China and Europe (CE).

design features & ratings

Nominal Horsepower Rating Basis

15,000 Btu per hour @ 85°F. inlet water, 0.00025 additive fouling factor and 105°F. condensing temperature, with a three gallon per minute (gpm) water flow and refrigerant 22.

Sizing by Nominal Horsepower

A condenser is properly sized when its capacity to transfer heat from the system is equal to the cooling load, plus the extra heat generated by the work of compressing the gas. This total is called the Total Heat of Rejection. For air-conditioning or a high back pressure system, it's safe and convenient to size by nominal horsepower. However, matching nominal HP can result in over-sizing for low and very low temperature applications. When your application varies from nominal-air conditioning or normal operating conditions utilize Standard Refrigeration's CSCAN selection software or condenser performance tables, which can be obtained at www.stanref.com or from customer service.

Pumpdown Capacity

Pumpdown figures have been compensated to provide capacity for R-22 based on 80% of condenser volume filled with liquid at 90°F.

Pumpdown requirements relate to the amount of refrigerant storage available in a condenser during operation or servicing. A pumpdown capacity of three pounds of refrigerant per ton will be sufficient for high back-pressure air conditioning, five pounds per ton for medium back-pressure air conditioning and up to seven pounds per ton for commercial refrigeration/low back-pressure systems.

Operating Charge

Approximately 10% of the pumpdown capacity is required for shell & tube models and 5% for shell & coil models for proper operation.

Nominal Water Pressure Drop

Nominal pressure drops (psi) given are at nominal flow rates. To determine nominal flow rates multiply nominal horsepower (hp) by 3.0. Water pressure drops provided do not include any external fittings or valves.

Pressure drop is defined as the loss of pressure due to friction and is the pressure difference between entering and leaving water sides.

Water Flow

Velocities of eight feet per second or higher risk premature impingement corrosion and tube failure. Operation below minimum flow rates may result in excessive fouling and poor heat transfer. All values in this catalog section are limited to flows below eight feet per second.

Custom Designs

Standard Refrigeration is always happy to design and build customized condensers if an application calls for special materials, additional valves, water or refrigerant fittings, mounting brackets or other accessories. Contact customer service for a quotation.

Clean ratings: As tested per ARI Standard 450-99

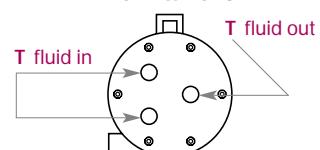

Fouled ratings: Include a additive fouling coefficient of 0.00025 as calculated per ARI Standard 450-99

† Tubing has high performance extended surface

• Constructed with three water fittings. Parallel outer fittings for nominal flow. HSE-3 has 1/2" center fitting

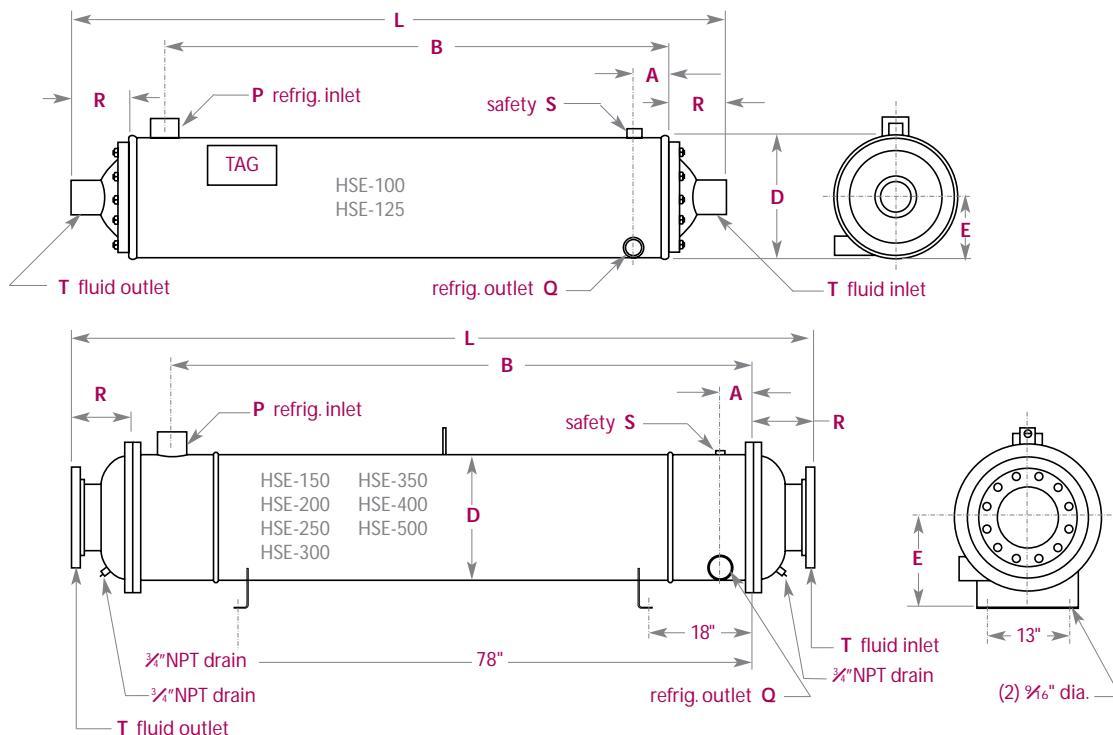

*HSE2 & HSE3

- Horizontal, cleanable shell and tube design
- New high tech enhanced copper tube geometry
- Smaller foot-print equals less space requirement
- Removable, epoxy coated, water plates to facilitate cleaning
- Epoxy coated tube sheets to prevent pitting caused by galvanic action
- Custom models available thru 800 horsepower
- 23 HSE models, 2 thru 500 horsepower

Clean ratings: As tested per ARI Standard 450-99

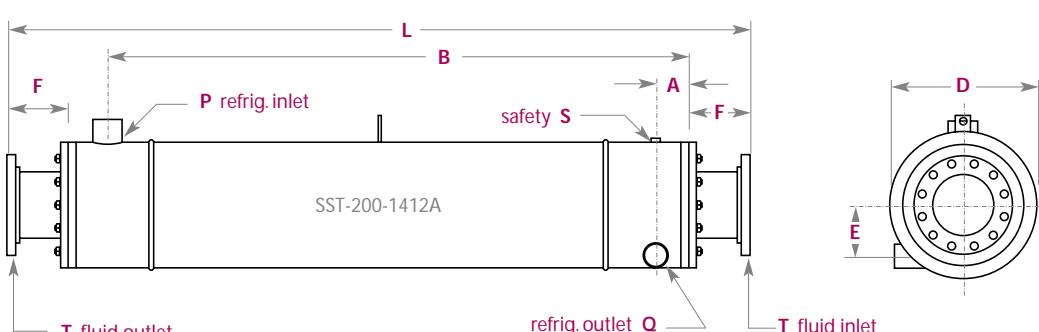

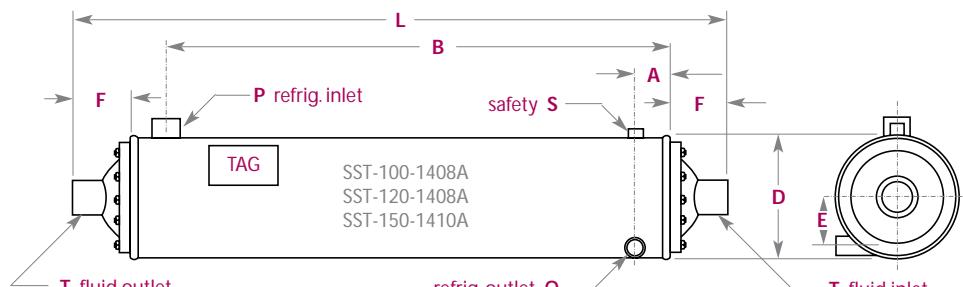

Fouled ratings: Include a additive fouling coefficient of 0.00025 as calculated per ARI Standard 450-99

† Tubing has high performance extended surface

- Industry's most widely used and trusted model
- Heavy duty, horizontal, shell and tube design
- Nominal ratings and sizes to handle the most demanding requirements
- Removable, epoxy coated, water plates to facilitate cleaning
- All copper, heavy wall, straight tube water channels
- Epoxy coated tube sheets to prevent pitting caused by galvanic action
- Generous pumpdown capacities
- Custom models available thru 800 horsepower
- 28 SST models, 3/4 thru 200 horsepower

HP

High Pressure/High Pumpdown Condensers

design features & ratings

- Ideal for high-rise building applications
- High Performance, horizontal, shell and tube design
- High Pressure, specially designed removable water plates and gaskets provide for a 300 psi waterside working pressure
- High Pumpdown, for containment of greater refrigerant charges
- New high tech enhanced heat transfer tube surface
- Epoxy coated tube sheets and water plates to prevent pitting caused by galvanic action
- 8 HP models, 10 thru 80 horsepower

CA

Stainless Steel/Corrosive Fluid Condensers

design features & ratings

- 316 stainless steel tubes
- 304 stainless tubesheets, water plates and waterside fittings for use with corrosive fluids. Especially suitable for pulp and paper mill applications
- Heavy duty, horizontal, shell and tube design
- Rolled tube to tube sheet joints
- Removable water plates to facilitate cleaning
- 6 CA models, 5 thru 30 horsepower

VSE-1/2 through VSE-2

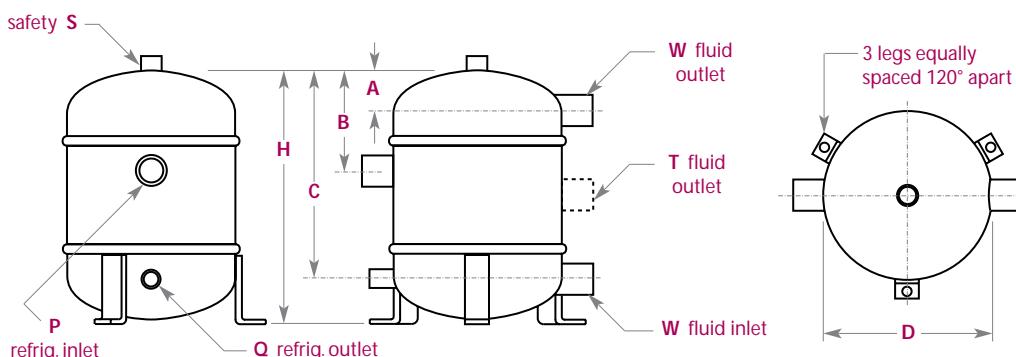

- Sealed construction, vertical, shell and coil design
- Greatest refrigerant pumpdown capacity in a upright compact package
- Special "T" models have auxiliary connection for tower applications or to reduce pressure drops
- Size and efficiency make it ideal for use in small package units; ice makers, vending machines, self contained refrigeration cases
- 11 VSE models, $\frac{1}{2}$ thru 20 horsepower

ELT

Compact Tube-in-Tube Condensers

design features & ratings

- Specially designed removable water plates and gaskets allow unsurpassed ease of servicing or cleaning without disconnecting water or refrigerant lines
- All copper water channels
- Rugged steel construction to resist tubing damage
- Our smallest horizontal, tube in tube design
- Exceptional heat transfer utilizing enhanced tube surfaces
- Highest water pressure ratings, and lowest water pressure drop offered in a cleanable tube in tube condenser design
- 7 ELT models, up to 10 horsepower

Chiller Barrel Sizing

Selecting the proper chiller barrel for your application depends on four basic sizing considerations:

Range

The desired temperature drop of the fluid measured as the difference between incoming and outgoing fluid temperatures.

Approach

The desired temperature difference between outgoing fluid and the refrigerant evaporating temperature.

Pressure Drop

Acceptable level of fluid pressure drop through the chiller barrel at computed gallons per minute (gpm) flow rate.

Capacity

Necessary heat removal (tonnage) at maximum operating load

After determining fluid temperature drop (Range), find the capacity table identified for the particular range. (If no table exists for that specific point, use the next lowest temperature range for which a table exists.) At the top of the table, various approach temperatures are given. Find the approach desired and read down the tons column until you reach a capacity adequate to do the job. The water pressure drop (psi) is listed next to the capacity figure. To determine gpm, multiply tons by the gpm factor, which is noted below each range chart.

Chiller barrels may be sized by other methods as well. Where the desired temperature range is known (difference between incoming and outgoing fluid), determine the Btu/hr capacity needed by multiplying the temperature range by gpm flow and convert to pounds of water per hour using the multiplier 500.

$$\text{Range} \times \text{gpm} \times 500 = \text{Btu/hr}$$

Another sizing method is by compressor capacity. Manufacturer curves showing compressor Btu/hr values serve as a simple guideline for selecting chiller barrels for a given system.

Also, Standard chiller barrels are rated to ARI standards and can be selected on a nominal system tons basis using the capacity charts in this catalog. This method, however, is recommended only for high temperature (air conditioning) systems.

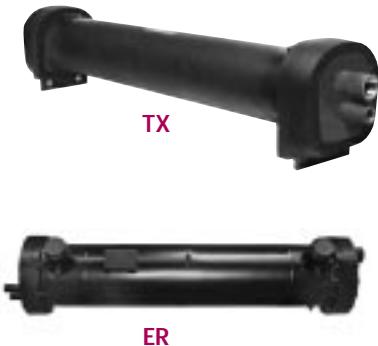

Water Nozzle Location

The standard water nozzle location is on the right as you are facing the refrigerant connections. Special top, and left side connections can be ordered.

Technical Assistance and Custom Designs

Standard offers custom design services and computer performance projections on all heat exchange products to help you match product and application accurately. You are invited to contact your nearest sales representative or our office headquarters for prompt assistance.

Chiller Barrels

design features & ratings

Conformance

Standard chiller barrels 6" and smaller OD shell are U.L. listed for 225 psi tube side and 225 psi shell side working pressures.

Units with 6 5/8" and larger shell are constructed to ASME Boiler and Pressure Vessel Code Section VIII, Div. 1. TXC units are rated for 225 psi tube side and 150 psi shell side working pressures.

ER Units are rated at 300 psi tube side and 200 psi shell side (non-code). Each unit is tested before shipment and ratings are developed through extensive laboratory testing and computer modeling.

Nominal Tonnage Rating Basis

Nominal ratings are based on ARI standard 480, specific conditions being:

1 ton = 12,000 Btu/hr	100° F. liquid entering TXV
54° F. inlet water	7° superheat
44° F. outlet water	35°F R22 Saturated Suction
0.0001 ft ² hr°F/Btu	fouling factor

Sizing by Nominal Tons

Sizing by nominal tons is done according to ARI standards. Chillers can be selected on a nominal system tons basis, as shown in the catalog, or reflected in the model name. For example, a TXC-50-2 is a nominal 50 ton dual-circuit barrel. This method is reasonably accurate for sizing air-conditioning systems. However, it is not recommended for evaporating temperature below 34° F, or when the fluids used are other than water and R-22. All heat exchangers have capacity limits and careless sizing of chiller barrels leads to needless performance problems. Undersizing can lead to insufficient cooling and inefficient compressor operation. Oversizing can lead to control valve hunting, poor performance, oil logging, and refrigerant slugging. When your application varies from nominal-air conditioning conditions, such as brine, low-temperature and process cooling applications, utilize Standard Refrigeration's CHILLY selection software or evaporator performance tables, which can be obtained at www.stanref.com or from customer service.

Limitations

1. For cooling water applications a minimum evaporating temperature of 32°F. should be maintained in the evaporator to prevent freezing.
2. Maximum water entering temperature of 70°F.
3. Minimum outgoing water temperature of 36°F.
4. Minimum approach 5° (for approaches 6° or less, system should be designed to insure proper oil return).

Note: For brine, low temperature and special design applications, please consult factory.

Note: Do not exceed maximum stated flow rate.

Technical Assistance and Custom Designs

Standard offers custom design services and computer performance projections on all heat exchange products to help you match product and application accurately. You are invited to contact your nearest sales representative or our office headquarters for prompt assistance.

**Clean ratings: As tested per ARI standard 480-01

Fouled ratings: Include a additive fouling coefficient of 0.0001 ft² hr°F/Btu over clean rating per ARI standard 480-01

- Serviceable
- 30% - 50% smaller than comparable models
- Easier to handle and position
- New advanced design
- UL listed or ASME
- ¾" insulation

- Single and dual circuit designs
- 3 and 4 circuit designs available
- 33 TX models from 2 thru 500 tons
- Ideal for OEM replacements
- New TXC designs for 30 thru 75 Tons

One-Pass or Three-Pass Replacement Evaporators

design features & ratings

Water Flow Rates

There is one baffle configuration per ER model. As a result, the water flow rate at the job site will need to be adjusted to obtain the design water flow rate. At a range of 10°F, the water flow rate should be 2.4 gpm/ton.

Construction Materials

ER evaporator shells are constructed with ASME grade carbon steel. Enhanced copper tubing is mechanically expanded for a superior seal into machined carbon steel tubesheets. Tubing wall thickness is 0.018". Removable endplates, refrigerant and water connections are constructed from carbon steel. All baffles are made from corrosion resistant materials.

Refrigerant Connections

The refrigerant side configuration for the ER evaporators is 3-Pass with nozzles at opposite ends. As a result, the refrigerant nozzles are on the same ends, but may not be in the same locations as the other OEM Single Pass evaporators.

ICE RINK CHILLER BARRELS

Standard Refrigeration can design special chiller barrels for Ice Rink applications special for your needs. Designs are available with enhanced copper tubing for ethylene glycol solutions or special cupronickel tubing for calcium chloride brines which are commonly used in Ice Rink systems

Our models are designed to boost efficiency, reduce corrosion and increase the life of your chiller. Special baffle designs are incorporated to reduce the pressure drops associated with the high flow conditions found in Ice Rinks and similar applications.

All chiller come with standard features like insulation, lifting lugs and feet for easy mounting. Standard's ice rink chillers are available in single and dual circuit designs and can be customized to meet your physical and performance requirements.

Call the factory or your local sales representative for sizing and selection information.

SCT

Vertical Subcooler

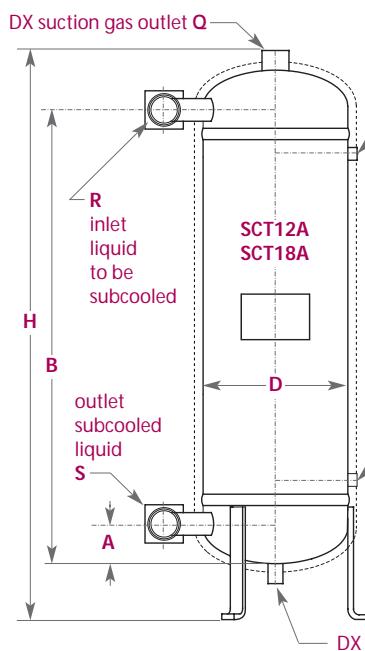

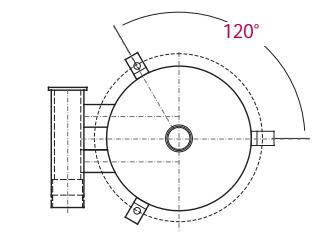

design features & ratings

- Vertical installation for smaller footprint
- Welded and sealed construction
- Conforms to ASME or UL requirements
- $\frac{3}{4}$ " insulation
- Rugged shell and coil design
- 6 SCT models from 2 thru 18 tons
- Increase BTU Loading
- Decrease Electrical Usage

CBKIT

Low-Side ChillerBuilder Kits

Kits Now Available up to 75 Tons

design features & ratings

- Uses super compact TX chiller barrel
- Brand name components
- One, two, three and four circuit options
- NEW three and four circuit models available, ideal for achieving up to 20 tons with single phase compressors
- Available in ranges from two to 75 tons
- Entire kit can be assembled in less than one hour
- Chiller barrel included

- Included components**
- Framework
 - Temperature controls
 - Low pressure switch
 - Expansion valve
 - Solenoids
 - Control power supplies
 - Freezestat
 - Flow switch
 - Sight glasses
 - Custom piping

3 & 4 Circuit

Liquid Receivers

design features & ratings

Conformance

Each Standard stock receiver conforms to UL, CSA or ASME requirements for 450 psi maximum working pressure. Models with an internal diameter under six inches are UL listed; all larger models are made according to ASME code and tagged appropriately.

Pumpdown & Refrigerant Charge

All pumpdowns are calculated at 80% capacity of liquid.

Approximately 10% of pumpdown capacity is required to operate receiver properly.

Custom and Ammonia Construction

Custom receivers for halocarbons and ammonia can be built based on application and construction criteria. Receivers may be ordered with or without extra features such as mounting brackets, fusible plugs, special fittings, liquid level indicators and alarm switches, to assure reliable service on virtually any application involving halocarbon type refrigerants.

Selection

Pumpdown Calculation Procedure

Refer to table for calculating pumpdown capacity of any Standard receiver design with elliptical ends. Pumpdown figures shown have been compensated to directly give capacity on 80% of the receiver volume filled with liquid at 90°F.

To figure pumpdown capacity, locate the receiver OD in the first column and read across to find the values for length correction and pounds of pumpdown for refrigerant used. Substitute those values in this formula:

$$\text{Pumpdown} = (\text{overall length} - \text{length correction}) \times (\text{pumpdown per inch})$$

To calculate overall length required for the given OD and specified pumpdown capacity, follow the same procedure given above, using this formula:

$$\text{Overall length} = (\text{pumpdown required} \div \text{pumpdown per inch}) + (\text{length correction})$$

Pumpdown Capacity Table

Receiver OD (inches)	Length Correction (inches)	Pumpdown Capacity pounds per inch effective length			End to Weld (inches)

Suction Accumulators

design features & ratings

- Vertical installation for smaller footprint
- Prevents compressor damage due to slugging of refrigerant and oil
- Positive oil return at all rated conditions
- Designed for low temperature application
- Low pressure drop
- Acts as a suction muffler
- Corrosion resistant paint
- Fusible relief device available on larger models
- A.S.M.E. Coded Construction

For other sizes, materials and other special applications, please contact the factory.

- Two-piece construction with rugged, high-temperature braze joints for fast, easy installation.
- Broad product range includes 10 SLC (copper) models from 1/2 hp to 20 hp, plus 5 SLS (carbon steel) models from 25 to 50 hp.
- Custom designs in copper or carbon steel are available to precisely fit your most exacting application requirements.
- All models are UL and CSA listed.

LLI / LLH components

part number GASKE 995

Neoprene flat gasket. Fits current indicator and alarm adaptor on units manufactured after 1972

part number INDIC 21

Replacement dial for LLI indicators

part number INDIC 49

Replacement switch for LLH alarms

Indicators

liquid level indicator

LLI

Magnetic liquid level indicators are an inexpensive, effective means of gauging the refrigerant level in a horizontal receiver. The dial reads percent of pumpdown capacity of the receiver: when the pointer indicates 100%, the receiver is 80% full of liquid.

Pounds of refrigerant can be determined by taking the indicated percentage of the specified pumpdown capacity of the receiver.

Normal location is on the side of the receiver, centered between the liquid inlet and outlet connections. Other locations may be provided if specified. Note that at least six inches are required between centers of adjacent liquid level indicator flanges, and also between a unit and the liquid outlet pickup tube.

These can be mounted in the center of either end, provided the respective inlet or outlet fitting is moved to 1½ tank diameters from that end.

Float and assembly dial are included.

liquid level alarm

part number INDIC 58A

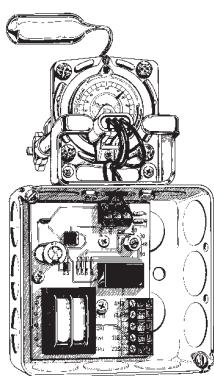

A liquid-level indicator is a single pole, single throw switch on which contacts close upon the decrease of the liquid level at 20% pumpdown.

Movement of the seamless aluminum float rotates a magnet on the inner side of the solid aluminum alloy head. The indicator pointer, or switch contacts, are on the outer side and are operated by a small magnet which follows the position of the inner magnet. There is no connection, except the magnetic field, between the inside and outside. Internal gears and bearings are stainless steel.

In case of external damage, the indicator dial or switch cartridge may be replaced from outside—the refrigerant charge is not disturbed.

Switch Duty	AC
Max. Volts	120/240
Max. Amps	1 (inductive)
Max. Watts	75/150

liquid level indicator-alarm

part number INDIC 210A

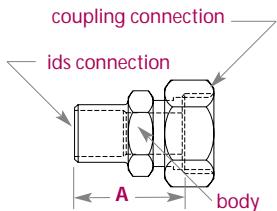

This indicator-alarm with selectable low-level point is designed for use in applications where low liquid level protection is desirable. It provides a relay circuit that closes at one of five user selectable levels of from 10 to 50%. The relay circuit can be used to drive a variety of applications from alarms to pumps. The indicator-alarm also provides a direct, visual indication of the liquid level in the tank.

Each indicator-alarm uses highly reliable and accurate, three wire, voltage divider technology to send the level signal to the level alarm, relay circuitry. The voltage divider uses thick film element in conjunction with a multi-fingered contact to ensure accuracy and reliability. The connector built into the indicator-alarm mates with a standard Packard automotive type, rubber sealed connector for easy installation and reliable connections.

Temperature	-20°C to 70°C (-4°F to 185°F), operating
Working Pressure	410 PSIG
Power Rating	5 amps, 240 VAC max.
Voltage Input	110 or 220 VAC
Gauge Mounting	Rochester Senior™ Adapter
UL Status	UL recognized for refrigeration

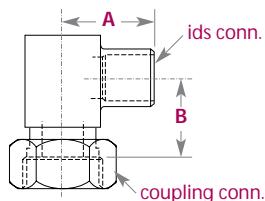

All indicators require a factory installed flange and are available for 8% OD and larger horizontal receivers, only. Flange cost is not included in cost of indicator alarm.

teflon fiber seal

valve and component notes

Steel valves and adapters with ids connections are electrotin plated and can be silver soldered. The valve stem packing can withstand considerable heat, but should be kept as cool as possible. Valves should be slightly open while soldering.

Teflon seals should be installed only after all soldering is completed. A seal is furnished with each valve, adapter or connection supplied on a vessel. Order additional seals for replacement only.

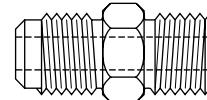

Steel valves with flare connections are cadmium plated. The stem packing will not withstand soldering temperatures, and the valve body must be protected if soldering is done near the valve.

valve-102	1/2	5/8	400 psi
valve-764	1/2	5/8	450 psi
valve-771	3/8	3/8	450 psi

protection notes

Relief valves are installed in a refrigeration system primarily to protect the vessel in the event of fire or other emergency high pressure condition.

Fusible unions and plugs protect only in the event of fire.

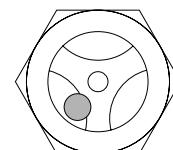

The 5/8-18UNF union or plug seats in a special 3/8" coupling with a copper zinc coated flare gasket, exactly as an SAE flare fitting. A conventional 3/8" mpt pipe threaded union, plug, or safety valve will also seal on the dryseal pipe thread of the coupling if ever necessary.

All systems must have a relief valve or fuse plug installed in order to comply with the ANSI B9.1 code.

Industrial Refrigeration Products

OCS

OCSF

TSC

OTW

AMC

AOP

AFV

Standard Refrigeration designs and manufactures a wide variety of industrial refrigeration products. Most cataloged products have been designed for use with R-717 ammonia. Products for industrial applications with halocarbons are also available.

Custom Designed Product

Due to the highly application-specific nature of most industrial refrigeration systems, many of Standard Refrigeration's heat exchangers and vessels are custom designed to meet our customer's needs. Components can be designed specifically to meet refrigerant, media and temperature requirements and a wide variety of materials can be specified as well. Vessels can be constructed to diameter sizes up to 60 inches.

Reciprocating Compressor Coalescing Oil Separators

Available in both hermetic and serviceable designs, coalescing oil separators provide oil separation and limit oil carry-over to approximately 3-10 pounds of oil per million pounds refrigerant depending on system characteristics such as operating conditions, refrigerant, start/stop and load/unload frequency, etc. Typical oldstyle mesh pad separators have carry-over rates on the order of over 10 times that amount. The coalescing oil separator provides a product that will assist in alleviating these concerns.

The OCS and OCSF line of coalescing separators is designed for reciprocating refrigeration compressors and suitable for ammonia (R-717), halocarbons (R-22, R-134a) and hydrocarbons such as propane (R-290).

Screw Compressor Coalescing Oil Separators

Screw compressors require increased oil flow and often require larger separator volume and additional separation methods. Oil separators can be custom designed to your screw compressor application.

Oil Coolers

Standard catalogs both ammonia themosyphon and water-cooled oil cooler designs. Ammonia themosyphon models are rated for use with 4GS oil at 130°F out and 95°F R-717 saturation, R-717 @ 4:1 overfeed and 0.0005 fouling factor. Water-cooled oil coolers are rated for use with 4GS oil at 180°F inlet and 135°F outlet, 85°F water inlet and 95°F water outlet. Custom units are available upon request.

Ammonia Flooded Evaporators

Flooded evaporators are available and can be custom designed to meet your application needs. Units can be custom designed with surge tanks, flange and special connections, waterboxes, sightglasses, oil skimmers, oil pots and level indicator connections. Flooded evaporators are generally built with carbon steel shell and tubing. Stainless steel or titanium tubing options are available as well.

Ammonia Water-Cooled Condensers

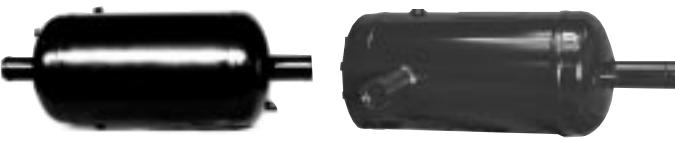

AMC water-cooled condensers are constructed with carbon steel shells and tubing and are cataloged for use with ammonia from 5 HP to 1,500 HP.

Ammonia Oil Pots

AOP oil pots are contracted with carbon steel shells and are built to 400 psi working pressure.

suction temperature _____ °F of refrigerant at evaporator

Fluid Circulated

- water _____ %
- ethylene glycol _____ %
- propylene glycol _____ %
- calcium chloride (CaCl₂) _____ %
- sodium chloride (NaCl) _____ %
- other _____ % if other,
specify properties at outlet temperature:
specific gravity _____
viscosity (centipoise) _____
thermal conductivity _____
specific heat _____

Construction

size: width _____ length _____ height _____

materials: shell _____ tube _____

working pressures: shell _____ psi tube _____ psi

connection sizes: refrigerant inlet _____ refrigerant outlet _____ fluid inlet _____ fluid outlet _____

warranty

Liability and Limitations

All products are thoroughly inspected and tested before leaving the factory, and are guaranteed against defects in material and workmanship to the extent expressly provided in this Paragraph. If it is proven to Standard/Stanref satisfaction that any part of any such product was defective when shipped from the factory, and such part is returned to Standard's factory in Melrose Park, Illinois or Stanref's factory in Bury St. Edmunds within twelve months of date of shipment thereof, transportation prepaid, Standard/Stanref shall either furnish a replacement part or repair such part (whichever Standard/Stanref may elect) free of charge and shall return such replacement part or repaired part to Purchaser, transportation prepaid. The foregoing shall not apply and Standard/Stanref shall have no obligation under this Paragraph with respect to any part or product which Standard/Stanref determines was subject to abuse, misuse, or improper installation or application. EXCEPT AS EXPRESSLY PROVIDED ABOVE, STANDARD/STANREF MAKES NO GUARANTEE OR WARRANTY EXPRESS OR IMPLIED WITH RESPECT TO ANY PRODUCTS SOLD HEREUNDER OR ANY PART OF ANY SUCH PRODUCT, INCLUDING (WITHOUT LIMITING THE GENERALITY OF THE FOREGOING) WARRANTIES OF MERCHANTABILITY AND WARRANTIES OF FITNESS OR SUITABILITY FOR ANY PARTICULAR PURPOSE, and Standard/Stanref shall have no other liability whatsoever with respect to such products or parts including (without limitation) any liability for indirect, consequential or resultant damages whether based upon breach of warranty, negligence or any other ground, it being understood that replacement or repair of defective parts as herein provided shall be Purchaser's sole and exclusive remedy.

Changes and Improvements

Changes and improvements may be made at any time in Standard and Stanref products, but Standard Refrigeration Company and/or Stanref International PLC shall be under no obligation to incorporate same in, or substitute the same for any products previously sold to any customer.

Merchandise Returned for Credit

No merchandise will be accepted for credit unless authority of the factory has been first obtained. Only merchandise of current design, in their original individual cartons will be considered for return—and if returned, a handling charge of 12% of the original net purchase price, plus transportation, will be made. No provision is made for the return of merchandise of special nature, and orders for special merchandise are not subject to cancellation.

Engineering Assistance

For assistance in the design, specification or use of Standard products, please contact your nearest sales representative or our office headquarters in Melrose Park, Illinois. In the United Kingdom contact Stanref International in Bury St. Edmunds, England.

Engineering specifications in this catalog are current as of the printing date, but are subject to future design changes. Consult factory for latest specification data before ordering.

Product performance is based on ARI standards and nominal operating conditions Standard Refrigeration Company is not responsible for product failure in nonconforming applications. For assistance, please consult the factory.
